**THINK DELIRIUM!**
Screen all patients aged 65 or over, or <65 with history of cognitive impairment, using the Confusion Assessment Method (CAM) tool below:

**Feature 1:** Acute onset of mental status change and/or fluctuating course (e.g. more confused than usual)

**Feature 2:** Inattention (difficulty concentrating, easily distracted)

**Feature 3:** Disorganised thinking (rambling speech, odd flow of ideas)

**Feature 4:** Altered level of consciousness

$$1 + 2 + (3 \text{ AND/OR } 4) = \text{Delirium}$$
